In their study on page 1472, Stephania Macchiarulo and Bernice Morrow showed in situ hybridization using a \textit{Jag1} antisense mRNA probe, and demonstrated that \textit{Jag1} expression was significantly reduced in the posterior, and to a lesser extent, anterior domains of the otic vesicle at E10.5 in \textit{Tbx1}^{Cre/} ; \textit{Jag1}^{flo x/} mutant embryos as compared to \textit{Tbx1}^{Cre/} ; \textit{Jag1}^{flo x/} and \textit{Tbx1}^{Cre/} embryos. Note that expression of \textit{Jag1} was also reduced in the pharyngeal apparatus but maintained in the forelimb, where \textit{Tbx1} is not expressed. \textit{Jag1} expression is also expanded throughout the OV in \textit{Tbx1}^{Cre/} embryos.
