

Cover: Safranin O/Fast Green/Hematoxylin-stained section of the proximal humerus from a 21-day old mouse with site-1 protease ablation in the osterix lineage. Image shows the slow development of the secondary ossification center, in which the epiphyseal cartilage is not completely replaced with trabecular bone at this stage. See article by Patra et al. (see bio032094). Cover image is licensed under a Creative Commons Attribution 4.0 International licence.
