

**Cover:** In the fruit fly, *Drosophila melanogaster*, the daily cycle of rest and activity is a rhythmic behavior that relies on the activity of a small number of neurons. The small ventral lateral neurons (sLN<sub>v</sub>s) are considered key in the control of locomotor rhythmicity. Pirez et al characterized the impact of different putative postsynaptic partners of the sLN<sub>v</sub>s on the control of rhythmic locomotor behavior. Shown here is a confocal projection of the expression pattern of the GRASP negative line 5-43 GAL4 (black), immunostained for the circadian marker PER (red) and the circadian neuropeptide PDF (blue). In this work Pirez et al found that novel non circadian neurons are relevant for the control of locomotor activity. Image licensed under a Creative Commons Attribution 4.0 International license.

## RESEARCH ARTICLES

A neurodevelopmental TUBB2B  $\beta$ -tubulin mutation impairs Bim1 (yeast EB1)-dependent spindle positioning  
**Denarier, E., Brousse, C., Sissoko, A., Andrieux, A. and Boscheron, C.**
